In Class Learnings Applied to Project

There are a few lessons and important learnings that were taken from classes and applied to the website development. Firstly, one of the more important facets of the project was ensuring there was no false-consensus effect. As developers and engineers, there cannot be an assumption that every single person will understand everything placed on the site simply because it makes sense to those who made it. This was proven, not only with peer feedback within the group, but with customer feedback regarding the cosmetics of the 'Repair Café' page. Further proof that the individual is not the whole. Building on this facet, as a group it is important to consider the seven fundamental design principles; such as the importance of feedback, discoverability, and understandability. It is important to recall how the target clientele will read the page, what will catch their eye first, and how to eliminate confusions and complex routes to one page. Because if the target clientele cannot locate something on their own site, it is at the fault of the designers and developers- not the website. It is also important to gauge the emotions of the client. To watch their face(s) and listen to their tone; to hear what they are not saying or perhaps do not know how to. Finally, with the 'in-progress' works, it is important to begin with what the client was specifically looking for. Once those goals are met, they can be refined with a meeting and feedback from the client. Additional details can be discussed during the same meeting or at a later date.
